

Patients were satisfied with the appearance of the glans and fully recovered their sexual activities. The sensitivity was slightly reduced in the area of excision in 2 patients. However this was not a matter of dissatisfaction. There were no serious complication sequellae requiring any kind of postoperative intervention.

DISCUSSION

In the current paper, we aimed to gather initial evidence for the potential safety and effectiveness of Veriset™ hemostatic patch in soft tissue bleeding during partial glans excision and „natural spontaneous resurfacing“. It
